

# Ayahuasca Ceremonies in Panama, February 2016

## Pilot test

A group of people during medical training in Panama with Dr Michael Borkin participated in two Ayahuasca ceremonies, organized by local people. Sputnik measurements were done during several days. We can see results at fig.1.

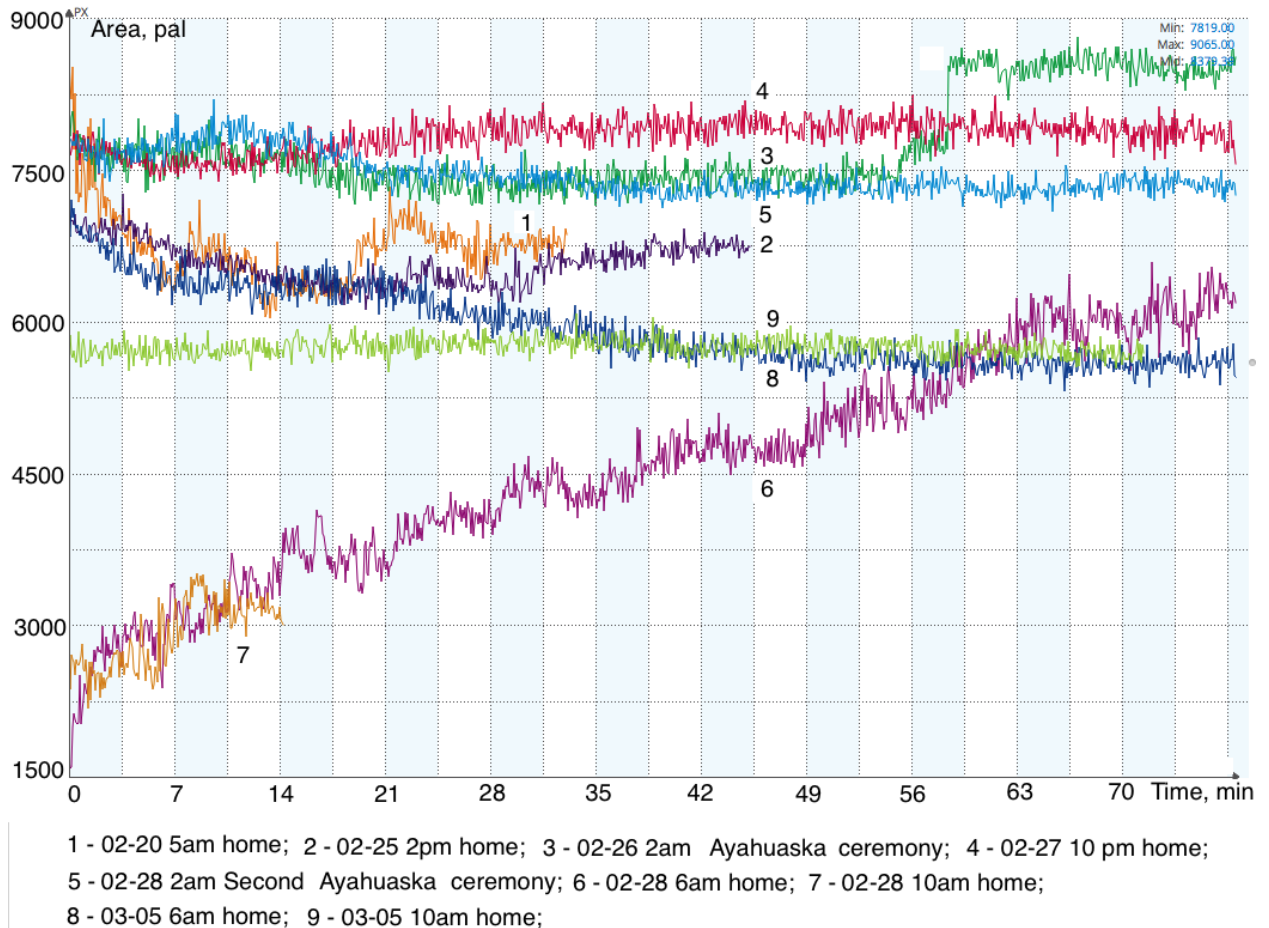

Fig.1. Time dynamics of Sputnik signal in different days.

As we see from the graphs, in the first 5 days signal was quite reproducible. During 2 days of ceremonies signal was different, but reproducible and stable, while on the next morning dynamics of a signal became different (curves 6 and 7); After several days it became stable again, but the amplitude dropped down.

### Conclusion

We may expect, that second ceremony influenced the Sputnik signal for at least one day, but this observation needs an extra confirmation in the next experiments.
